REASON FOR ALLOWANCE

1. Bishop discloses a vehicle comprising a self-steering railway bogie with at least one steerable wheelset adapted to run on a guideway having two primary running faces laterally offset about the centerline of the guideway, the wheelset comprising a pair of wheels, each wheel located on opposite sides of the wheelset adapted to engage with a respective one of the two primary running faces, the vehicle further comprising a mechanism arranged and constructed for steering the bogie in response to the inclination angles of the axle sets operably connected to an actuating means to steer the wheels in response to the sensed steer angle, the axes of rotation of the wheels and the primary running faces are inclined downwardly toward the guideway centerline; wherein each wheel exceeds an engagement force with its respective primary running face, the engagement force on each wheel comprising a perpendicular component to its respective primary running face and a parallel component to its respective primary running face substantially perpendicular to the guideway centerline, wherein horizontal forces acting on the wheelset substantially transversed to the guideway centerline are substantially resisted by the sum of the horizontal vectors of the perpendicular components; wherein each wheel exerts an engagement force with its respective primary running face. Chollet et al teach the use of sensing means comprising of a sensor positioned either ahead, behind or laterally offset with the wheelset for sensing lateral displacement of the wheelset with respect to a longitudinally disposed reference path including a control system for processing the sensed signal to a self steering device. Hase discloses a bi-directional operating automated guided transit system

Art Unit: 3617

comprising sensing means positioned on a longitudinally disposed reference path which is substantially contiguous with the guideway centerline of a self-steering vehicle. The system also permit an operator to bypass the sensor signal and to manually steer the vehicle. McSparran et al disclose a system for automatically controlling an electrically propelled traction vehicle comprising a proximity sensing means on the vehicle including malfunction indicating means for detecting any discontinuity in the normal sequence of output signals. However, none of the references of record suggests a vehicle with at least one steerable wheelset, wherein a secondary running face lies immediately adjacent to, and substantially parallel to, at least one of the primary running faces including sensing means for sensing lateral displacement of the wheelset with respect to the at least one secondary running face to produce a signal to a control system for steering the vehicle in the manner defined in the instant claim 14 and in combination with other limitations of the claims. Therefore, claims 15-18, depending therefrom are considered to be allowable.
